

COMPONENT	WHAT IT IS FOR
Fuselage	The body of the aircraft: the cabin for the pilot, passengers and baggage. The wings, tail, landing gear and engine are all attached to it.
Wings	Produce the lift and hold the fuel tanks. Ailerons and flaps are hinged to the trailing edge; a strut braces each wing to the fuselage.
Empennage (tail)	The fin and the horizontal stabilizer keep the aircraft steady in flight; the rudder and the elevator are hinged to them.
Landing gear	Fixed tricycle gear: a steerable nose wheel and two main wheels with brakes on spring-steel legs.
Powerplant	Lycoming O-320-H2AD engine of 160 BHP driving a fixed-pitch propeller. The cowling encloses the engine and guides the cooling air.
